TC-SIM

The Transport and Carbon Simulation model (TC-SIM) is being developed as part of the VIBAT London study.

TC-SIM is a participation tool which includes a scenario building and policy discussion platform, around which decisions in relation to possible future scenarios and policy packages can be made. The aims of the tool are to provide:

- An interactive tool for scenario building and policy packaging
- A collaborative platform for discussion and decision making
- A graphical interface to visualise policy packages in space and time
- An engaging and pedagogical tool for communication of policy

TC-SIM
